A real world
Contact Tracing
example – Sports Cluster part 1

One person with COVID-19 attended an indoor sports team practice, which led to 60 people (and that number is continuing to rise) testing positive with COVID-19 in 18 days:
• 170+ high risk contacts who needed to self-isolate
• 2 outbreaks in schools
• 1 outbreak in a daycare
• 5 sports teams impacted
• 1 person presumptive of COVID-19

This graphic shows transmission up to October 20. Transmission continues in the community related to this sports team cluster, including into healthcare settings and other workplaces. In order to avoid double counting the number of people with COVID-19, individuals are only shown in the setting they were initially exposed to the virus and not counted again in the setting where the virus was spread to their close contacts.
